Other Information

Premature ejaculation and Priligy

In some men the normal process of ejaculation is affected by rapid climaxing during sexual intercourse.

The condition known as premature ejaculation or early ejaculation makes the normal sexual life impossible due to unexpected and uncontrollable ejaculations of a man.

Premature ejaculation is considered being one of the most common ailments influencing men periodically. Still some men experience persistence inability to control their ejaculations and suffer from various related issues such as depression, lack of confidence, stresses and emotional imbalance.

What to do if your sexual partner expects you being longer in bed? The problem is effectively coped with the help of the medicine called Priligy.

The uses and action of Priligy

The medicine improves even severe types of premature ejaculation and significantly prolongs the intravaginal ejaculation latency time (IELT).

Priligy is a safe and well tolerated medical treatment of premature climaxing. The main component in the drug is Dapoxetine hydrochloride which is an antidepressant by its nature.

The short-acting Dapoxetine does not show any negative effects which most antidepressants have. It works during very short time in the body and produces the effects of delay in the time to ejaculation.

High efficacy and safety of this medicine is proven in various medical tests involving men with PE. Priligy is widely prescribed for men with this condition as a really effective remedy with proven actions.

Priligy method of application

Priligy is an innovative medication designed for oral use as needed. Men take Priligy 1-3 hours before sexual activity to regulate the ejaculation process and have longer sexual activity.

The medicine can be taken with food or without it. The dosage prescribed for most men is 60 mg. This is the safe and effective dosage for acquiring best results. Patients should wait for about 24 hours before using the next dose of Priligy.

Before using the medicine, it is better to consult a doctor. Follow the advice and recommendations of your doctor to avoid side effects and achieve the max from the treatment with Priligy.

Priligy is not administered for men who have liver impairment, heart problems or kidney failure. In case you have the following conditions ask your doctor about possibility to use Priligy: any mental disorder especially bipolar disorder or mania, psychosis, seizures, diabetes, allergic reactions to Dapoxetine.

Priligy drug interactions and side effects

Priligy 60 mg does not interact with other medications or alcohol. It can be used with oral ED treatments such as Viagra or Cialis. Still if you want to use Dapoxetine with other medicines, ask your doctor for consultation.

Side effects of Dapoxetine reported by most patients are of minor character. They include dizziness, light-headedness and headaches. No serious side effects were reported during the testing period or clinical trials. Still if you use Priligy for PE treatment, be attentive to your general health condition. In case of any deterioration, please consult your doctor.
