## Other Information

Sexual stimulants are products that can help a person regain a lost level of desire or enhance the experiences a person currently has. There are a wide range of products that are supposed to have this ability. Some are natural, such as ginseng and yohimbe, and others are manmade, such as Viagra and Cialis.

Many people are familiar with ginseng, but they may not be aware of its long history of being used as a sexual stimulant. The Chinese were one of the first groups known to use the herb for this purpose. In modern times, members of other cultures have begun to recognize that ginseng boosts a person's vitality and improves his muscle stamina.

Viagra (Sildenafil) was the first oral medication approved by the Food and Drug administration (FDA) for the treatment of erectile dysfunction. Introduced into the market in 1998 Viagra has arguably had the largest social and cultural impact (in terms of sexuality) of any prescription medication since the birth

control pill.

Viagra is a common cultural reference for anything from a quick sexual thrill to the complicated ways that large companies can manipulate the media and individuals to purchase products they design. Viagra has also had a significant impact on the sex lives of individuals taking the drug (and those who have sex with them) but this impact is less straightforward than marketing materials lead one to believe.

### How Viagra Works

Viagra works by relaxing muscles and increasing blood flow to particular areas on the body. Viagra was originally studied for the use in people with high blood pressure and cardiac problems. The studies uncovered an interesting side effect, which was that men who were experiencing erectile dysfunction reported that their erections were returning.

Viagra only works with sexual stimulation, so taking a pill will not give a man an erection, but it will increase the likelihood he'll get an erection once he is sexually stimulated.

### How to Take Viagra

Viagra comes in three doses, 25mg, 50mg, and 100mg. The manufacturer recommends the 50mg pill as the dose for most people. While online Viagra is widely available, I strongly recommend talking to a real live doctor, preferably one you know, before taking Viagra. After you take a pill it should work within 30 minutes to 1 hour, and lasts about 4 hours. You should not take more than one pill in a 24-hour period.

### Viagra Side Effects

The most common side effects of Viagra are:

- headache
- facial flushing
- dizziness
- upset stomach
- visual problems (bluish vision, blurred vision, sensitivity to light)

Do not take Viagra if you use nitrate drugs, which are used to treat cardiac problems. If used in combination with Viagra, these types of drugs can cause the blood pressure to drop to unsafe, sometimes even life-threatening levels.

People with cardiac problems, anatomical malformations of the penis such as Peyronie's disease, multiple myeloma (a form of cancer), leukemia, liver problems (especially severe liver disorders), kidney problems men with a predisposition to prolonged erections caused by sickle cell anemia, and people taking certain medications used for HIV or those over 65 should NEVER take the drug unless prescribed by a medical practitioner.

In the event of an erection lasting more than 4 hours, seek immediate medical help to avoid long-term injury.

There have been a few cases of men reporting sudden vision loss or hearing loss. If either of these occur you should stop taking Viagra and see your doctor.
